Dear County Commissioners and BOH,

I have been told that the many studies that show that glyphosate, the main ingredient in Roundup, which is found in over 80% of processed foods now is simply a "witch hunt" against Roundup. The attached study shows that what my colleagues and I said the wildlife birth defects and health issues indicated about exposure to Roundup/glyphosate were true.

This study confirms everything our wildlife studies indicated and much more with regard to harmful effects on thyroid hormone function and gene functions.

Also see the Glyphosate Summary document.

Sincerely,  
Judy Hoy
